

Epilepsy

The brain is made up of these little things called neurons. Neurons talk to each other by sending electrical signals, but the signals have to be working together.

Like traffic lights. Some go red, some yellow, and some green so cars can move smoothly and not crash.

Right. When some of the neurons are out of sync with the others they may cause a seizure. Imagine what would happen if the traffic lights were all out of whack...like they ALL turn green at once.

Yep. Lots of accidents.
