

Germs

Germs are everywhere, and always looking for a chance to attack. There are 4 major types of germs...

I remember this! Bacteria, viruses, fungi and protozoa.

Germs are always around. And, they're always looking for a chance to cause an infection. Whenever you have a break in your skin, like if you fall and scrape your knee or if the doctor has to make an opening in your belly to take out your appendix, germs will try to use that opening as a way to get in and cause an infection.
