

# Generalized Seizure

It's time for "What's That Mean?" Today....

Experts divide seizures into "partial seizures" and "generalized seizures."

When all the neurons start misfiring at once, it's called a generalized seizure.

When this happens, a person can fall and their whole body starts jerking.

A person may even make sounds, but they are not in pain.

They are not awake, but the seizures usually only last a few minutes.
