

Plantar Fasciitis

Plantar fascia

Plantar fasciitis

Small tears

Overview

Plantar fasciitis is an irritation of the plantar fascia. This thick band of connective tissue travels across the bottom of the foot between the toes and the heel. It supports the foot's natural arch. It stretches and becomes taut whenever the foot bears weight.

Causes

Plantar fasciitis is caused by repetitive stress or excessive tension on the plantar fascia. Small tears can develop in this tissue. It can become irritated and inflamed.

Symptoms

The pain of plantar fasciitis feels like a stabbing sensation in the heel of the foot. This pain usually develops gradually. It is typically worst in the morning, when a person takes the first few steps out of bed. Plantar fasciitis may affect one foot, or it may be felt in both feet.

Care and Management

Chiropractic care has proven to be safe and effective for patients suffering from plantar fasciitis. Care options may include adjustments, orthotics, stretching exercises, ice, and lifestyle modifications.
