

## Partial Hip Resurfacing (Wright)

### Overview

This surgery replaces the diseased and damaged parts of the femur (thigh bone) with a metal ball component.

### Damaged Bone Removed

After the femur is separated from the hip socket, the damaged area is removed. The ball is reshaped to fit the femur implant.

### Component Attached

A metal ball component is attached to the reshaped femur.

### End of Procedure

The new ball is joined to the hip socket to form the new hip joint.
